

The following is a clean version of the foregoing amended specification.

ABSTRACT

A collapsible fish cleaner in the form of a V-shaped trough or holding tray with integral ends that performs similarly to welded or molded fish cleaners to securely hold fish for cleaning on the outside of a boat. Seven integrally incorporated hinge assemblies allow the device to be folded completely flat without disassembly. The device is made ready by unfolding from the flat storage position to the V-shape. The hinges are an integral part of each of six parts interfacing with each other on seven axes in this design. In the use of the device, a support flange rests on the side gunwale of a boat, secured to the boat by a quick release connector.
